

Species Audit - explanatory notes

Framework of the Species Audit

The Species Audit identifies species of concern occurring in the Isle of Wight. The following criteria have been used for selecting these species:

1. National BAP Priority Species

Those species listed by the UK Biodiversity Group, amalgamated from the original 'short' and 'middle' list species in *Biodiversity: the UK Steering Group Report*). These are classified as species which qualify for one or more of the following categories -

- Species which are globally threatened
- Species which are rapidly declining in the UK, ie by more than 50% in the last 25 years.

2. Species of National Conservation Concern

Those species on the 'long' list in *Biodiversity: the UK Steering Group Report*. These are classified as species which qualify for one or more of the following categories -

- Threatened endemic and other globally threatened species.
- Species where the UK has more than 25% of the world or appropriate biogeographical population.
- Species where numbers or range have declined by more than 25% in the last 25 years.
- In some instances where the species is found in fewer than 15 ten km squares in the UK.
- Species which are listed in the EU Birds or Habitats Directives, the Bern, Bonn or CITES Conventions, or under the Wildlife & Countryside Act 1981 and the Wildlife Order (Northern Ireland) 1985.

3. Species listed in the relevant national Red Data Books or lists.

4. Locally important species

Those species identified as being locally important by virtue of their rarity, rapid decline and/or isolation. Also species for which the Island holds regionally important populations.

The abundance of species For all species other than birds, the descriptions are interpreted as follows:

Common - recorded at a large number of sites and/or seen every year

Occasional - found at several sites / not necessarily seen every year

Scarce - found in 3 - 4 sites /infrequent records over last 25 years

Rare - found in one or two sites / rarely recorded over past 25 years

Believed extinct - not known on the Isle of Wight since 1975

For birds, the descriptions are interpreted as follows:

Common - widespread resident

Localised - regularly recorded in a limited (4-10) number of sites

Scarce - regularly recorded in 1-3 sites

Rare - not recorded annually

Believed extinct - not known on the Isle of Wight since 1975

Species believed to be extinct are listed separately.

Populations fluctuate from year to year due to a variety of causes, some of which are better understood than others. If the population fluctuates up and down $\pm 25\%$, the population is described as stable. If the population change is upward over a number of years, then the trend can be described as increasing (more than 25% increase); similarly downward change over a number of years is declining (more than 25% decline). For a number of species, the population trend is unknown.
